A talk by Rajat khare Intuit

Rajat Khare who works at **Intuit** talked on how they have embraced GraphQL at scale in the entire Intuit Quickbooks product over the last 2 years and how they have been running Intuit Quickbooks for 4 million customers on GraphQL. He gave an insight into how they went through learning about the advantages, opportunities, and challenges while converting an existing Dojo/REST API based application to this stack.

GraphQL is a query language for APIs and a runtime that answers to those specific requests. It allows users to develop original APIs. Users can request specific fields over the API, and they will only receive those fields. Additionally, while retrieving data from numerous sources in a single request, GraphQL queries enable rapid examination of resource references.
